Magnys Wins Contract With Major Computer Company

Novi, Mich., **February 2, 2007** – Magnys Innovative Solutions, a global leader in emulation solutions, has been tapped by a global computer company to help it maximize efficiency within its manufacturing facilities.

According to Joe Hukan, general manager for Magnys' emulation business, his team is working with the company to create a virtual test environment for manufacturing facilities that allow the customer to custom-build and ship computers and servers to customers around the world.

“The ability to provide customers with the means to order products that meet their specific needs is a significant competitive advantage, but also one that has led to incredibly complex manufacturing systems,” Hukan observed. “As part of our customer’s ongoing focus on streamlining their operations, Magnys is helping them anticipate and resolve challenges in their manufacturing control systems before they become problems that could affect the ability to meet customer needs.”

Emulation is not the same as *simulation*. Unlike simulation, which predicts behavior based on modeling data generated from programmed scenarios, emulation communicates directly with the actual PLCs used in production. This critical difference improves quality and leads to significant time and cost savings by allowing controls engineers to evaluate their ladder logic before production equipment is built or reconfigured.
